TMR1343

TMR Omnipolar Switch

General Description

TMR1343 is a digital omnipolar magnetic switch that integrates TMR and CMOS technology in order to provide a magnetically triggered digital switch with high sensitivity, high speed, and ultra-low power consumption. It is designed for use in applications that are both power-critical and performance-demanding. It contains a push-pull half-bridge TMR magnetic sensor and CMOS signal processing circuitry within the same package, including an on-chip TMR voltage generator for precise magnetic sensing, a TMR voltage amplifier and comparator plus a Schmitt trigger to provide switching hysteresis for noise rejection, and CMOS push-pull output. An internal band gap regulator is used to provide a temperature compensated supply voltage for internal circuits, permitting a wide range of supply voltages. The TMR1343 draws only 1.5μA resulting in ultra-low power operation. It has fast response, accurate switching points, excellent thermal stability, and immunity to stray field interference. It is available in the LGA2x1.5x0.63 -3Lpackage.

Features and Benefits

- Tunneling Magnetoresistance (TMR) Technology
- Ultra Low Power Consumption at 1.5uA
- High Frequency Response > 1kHz
- Operation with North or South Pole
- Low Switching Points for High Sensitivity
- Compatible with a Wide Range of Supply Voltages
- Excellent Thermal Stability
- High Tolerance to External Magnetic Field Interference
- Super small size package LGA2x1.5x0.63 -3L

Applications

- Utility Meters including Water, Gas, and Heat Meters
- Proximity Switches
- Position and Speed Sensing
- Motor and Fan Control

Output Behavior vs. Magnetic Pole

Parameter	Test Conditions	Output
South Pole	B > B_{OPS}	Low (On)
	0< B < B_{RPS}	High (Off)
North Pole	B < B_{OPN}	Low (On)
	0 > B > B_{RPN}	High (Off)

Note: when power is turned on under zero magnetic field, the output is “High”.

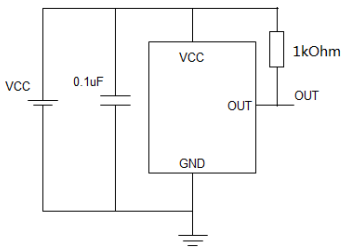
Application Information

The output of the TMR1343 switches low (turns on) when a magnetic field to the sensing axis exceeds the operate point threshold, B_{OP}. When the magnetic field is reduced below the release point, B_{RP}, the device output switches high (turns off). The difference between the B_{OP} and B_{RP} is the hysteresis B_H of the device.



It is strongly recommended that an external bypass capacitor be connected in close proximity to the device between the supply and ground pins to reduce noise. The recommended value for the external bypass capacitor is 0.1μF.
